*Description of followup or activity*

ATSDR ERS Joe Little reviewed the sampling data with me and OSC Ham. He felt that the 700 ppm lead in the playground did not represent a contact threat, given the circumstances of the sampling (sample was a composite taken from cracks in paving and in area of former lamp post at the park). This is also close to an expected background level in an urban industrialized area. He did not recommend further action on EPA's part regarding this result.
